

PRESS RELEASE PRESS RELEASE PRESS RELEASE PRESS RELEASE PRESS RELEASE PRESS

RELEASE DATE: 13 SEP 2022

Air-taxi services for visitors and residents of WASL properties, hotels, golfing and boating venues.

FLUTR (the Urban Aerial Mobility company) is pleased to announce a new partnership with **wasl** (the Gulf's largest property developer) to provide aerial mobility services for their 47,000 residential and commercial properties, hotels/apartments, golfing and boating venues, including the portfolio of internationally recognized brands including Le Meridien, Al Mina, Dusit, Hyatt, Hilton, Mandarin Oriental and Marriott brands, as well as some of Dubai's most iconic leisure-based venues, the Dubai Creek Golf & Yacht Club, Dubai Creek Marina, Emirates Golf Club and Jumeirah Golf Estates.

Wasl and FLUTR will partner to create an incredible transport experience while reducing travel times and transport friction for these venues via this new aerial mobility option.

FLUTR Urban Aerial Mobility, whose team has a strong aviation background in innovative urban aerial mobility solutions and airline based operations, and is focused on developing low-cost and low-noise air transport solutions, will provide the vehicle and operating services, while **wasl** will provide locations for take-off and landing.

The FLUTR network is designed as a low-cost point-to-point air transport network to get people from A to B, as fast as possible, by air, at the lowest possible cost, and is designed from inception to service the broad array of use cases of **wasl's** tenants and visitors at their residential, commercial and leisure properties, utilizing the FLUTR 2 and 3 seat VTOL vehicles.

PRESS RELEASE PRESS RELEASE PRESS RELEASE PRESS RELEASE PRESS RELEASE PRESS

Initially focusing on Airport routes To/From wasl properties, the passengers and their luggage will be able to flutter to any airport in the region in just a few minutes, and later to almost any destination in the region.

Traveling at up to 250kph (155mph), in a comfortable low-cost volume produced air vehicle, powered by sustainable fuel or battery, and controlled by conventional, automatic or remote piloting technology, passengers will be able to hail a ride directly from FLUTR or find the nearest available vehicle and self-fly.

The FLUTR air transport system is designed to tiptoe on the environment, being designed from the outset to work from existing buildings, taking off and landing on forecourts, driveways, carparks and low-traffic streets, avoiding the traditional requirements of having to install carbon-intensive and expensive infrastructure and ground handling facilities.

The breakthrough is the integration of the operation from existing buildings; taking off and landing on forecourts, driveways, carparks and low-traffic streets, avoiding the traditional installation requirements of carbon-intensive and expensive ground facilities.

Each vehicle will be equipped with new technologies that traditional helicopters aren't able to offer, such as shrouded rotors for bystander safety, parachute, bump tolerant structure in case of light ground collision, remote pilot communications, electric wheels for ground maneuvering, air traffic anti-collision, battery and sustainable fuel (SAF) options, and many more.

The network will launch upon successful testing and verification of the vehicle and systems to standards according to the government safety authorities GCAA (UAE), DCAA (Dubai) and EASA (Germany), at a date yet to be announced.

CEO Cameron Spencer says "It is a challenge to incorporate this much functionality and performance into such a small vehicle (only a single car park space when folded), but we didn't want to compromise on the vision of being able to zip through all the local airspace around us that is essentially un-used, being able to get anywhere by air on-demand,. This is not only an exciting innovation for Dubai, but a big move forward for aviation and urban aerial mobility".
